#### Abstract

Indian are witnessing a changing pattern of child sex ratio which is a serious problem with severe socio economic, demographic, and cultural consequences. In the last decade, the drastic decline in child sex ratio found to be an important issue which make a grave concernin rural Indian context especially some of the rural districts of West Bengal includingBirbhum. The researcher tried to examine the ground realities and demographic scenario of Birbhum district where gender inequality is a serious problem in fabric of the society. This paper has mainly dealt with subject related to character of child sex ratio whether it isdeteriorated or improved, considering various socio-economic factors which are regarded as important determinants of different gender preferences in the Birbhum district of WestBengal. In spite of higher mortality predominance for male child, the female child was havinga decrease ratio during (0-6) years. That is why the study has revealed special attention onage of the respondents of schedule caste, schedule tribe, Muslim and other communities specifying age at marriage, numbers of children, structure of houses, income, education, job pattern, women's status for studying the nature of child sex ratio. It was observed that skewedin girl child population leads to serious demographic imbalance and adverse social consequences. Accordingly, the researchers have taken an effort to examine the plight child sex ratio, its actual causes and significance in society with the help of worthy methodology and correct field data.

Keywords: child sex ratio, socio economic, gender preferences, mortality rate, demographic imbalance, skewed ratio.

## Introduction

Demography is the methodical research of population. Demography study trends and activities related to population including changes in population size, pattern of birth, death, migration and structure and composition of the population. Sex compositions of human population is a demography characteristic which influence the social economy and structure relationship among the human beings within the community. There are different types of demography including formal demography which is to a largely numerical field and social demography which demographic studies are based on process counting or enumeration such as census or survey which involved systematic collection of data on the people residing within a specified

UGC CARE Listed ( Group -I) Journal Volume 11, S Iss 3, 2022
territory.
Child Sex composition is one of the important demographic parameters which determines the balance between females and males child. In India, sex ratio is expressed as the number of females per 1000 of male. Similarly, child sex ratio is defined in the same manner as the number of females per thousand of male age group (0-6) years. Sex ratio is internationally defined as the number of males per 100 females. There are so many factors a responsible for biased sex ratio specially in favour of males than females child. In fact, sex ratio at birth reduces as the age increase, since adult make a higher death rate of male as compared to female and they are more exposed to threats as compared to female. Hence, sex ratio in entirepopulation is needed ideally balanced sex ratio.
"Gender equality is more than a goal in itself, it is a precondition for meeting the challenges of reducing poverty, promoting sustainable development and building good governance" -- Kofi Annan (a noble peace prize winner.)

## Demographic profile of children in India West Bengal and Birbhum district.

Annually a survey report, 26 million of children are born in India. There is a decline of 5.05 million in the population of children (0-6) years during decade 2001 to 2011. The decline in male children is 2.06 million and female children is 2.99 million. Child sex ratio changes because of introduced modern technology as the reason female foeticide. Apart from urban area the sex determination facilities even access to rural area and the easy availability of modern technology causes changes of rural child sex ratio.

Table No -1: Decadal variation of child sex ratio.

| Child Sex Ratio | 2001 | 2011 | Change |
| :--- | :--- | :--- | :--- |
| India | $\mathbf{9 2 7}$ | $\mathbf{9 1 8}$ | $\mathbf{- 9}$ |
| West Bengal | $\mathbf{9 6 0}$ | $\mathbf{9 5 6}$ | $\mathbf{- 4}$ |
| Birbhum | $\mathbf{9 6 4}$ | $\mathbf{9 5 9}$ | $\mathbf{- 5}$ |

The sex composition by age group especially (0-6) years is vital for studying the demographic trends of child population in India. It has declined from 927 in 2001 to 918 in 2011 census. The decreasing child sex ratio will have a cascading effect on population over a period of time leading to diminishing sex ratio in India. The decline in child sex ratio was even sharper and the gap of child sex ratio between two census is negative ( -9 ). The state of West Bengal has recorded child sex ratio always upward trend in compared to National level. West Bengal has registered child sex ratio 960 in 2001, a downward trend to 956 in 2011 census. The gap in child sex ratio from 2001 to 2011 census revealed a negative ( -4 ). The declining trend continued even in Birbhum district, where child sex ratio dropped from 964 in 2001 to 959 in 2011 between two census is negative ( -5 ). The district of Birbhum has always played a significant role in socio economic and political scenario in the state of West Bengal.

## Focus of the study

Accordingly, the researchers have derived an attempt to examine the trend of declining child sex ratio and its particular reasons and consequences with the guidance of suitable objectives in the selected villages under Mayureshwar-II Block and Nalhati-II Block in Birbhum district. The present study concentrates on child sex ration in age groups (0-6) years as because it is most useful tools to realize the real pictures of gender discrimination an affected by other.

## Objectives of the study

The following objectives have been formulated for the present study which include
(1) To study the socio-economic condition of households and the changing pattern of child sex ratio in the study area.
(2) To study the attitudes of household members regarding sex preferences.
(3) To understand the sex ratio specific differences in the childcare practices.
(4) To assess the awareness level of household members regarding discriminations between girls and boys and its impact on the society.

## Literature review

Review of current investigations in the area of research enable the researcher to accustom with trends of present research practices. UNICEF (1998), Girls in India are discriminated against in other ways as well, fewer months of breast feeding, less nurturing and play less medical treatment if they fall ill less special food, less prenatal attention. As a result, girls are more susceptible than boys to disease and infections, leading to for health and shorterinfections lifespan. It is this life- long discrimination in nurturing and care that is the real killer of girls less visible and less dramatic, but as unequivocally lethal as female foeticideand infanticide. Tinnari, (2002) mentioned in the study that son preference is considered to be the strongest among the middle-income group. The main reasons for son preference were due to perpetuates the family name and inherit property which are providers in old age and to perform the last rites. Yadav and Badri (1997), the region for wanting a son is to attain moksha the last rights and to continue the family lineage. Miller (1997) in her study, "The endangered sex", emphasized the social- cultural discrimination against female children asthe main reason for female motility. Miller called this as "extended infanticide" where life sustaining inputs like food, nutrition, healthcare were denied to a girl child. There is a great deal of evidence of girls being given less food and health care than boys. Girls are breastfed for shorter periods; they are taken to fewer medical consultations, and often very late, or notat all, to hospitals. Reasons for son preference were that they perpetuate the family name and inherit property, they are providers in old age and to perform the last rites (MOHFW and TINNARI). The reason for wanting a son is to attain moksha (Prasad, 2001 and Nayar, 1995) power, prestige to perform the last rites and to continue the family lineage (Yadav and Badri, 1997). Rapid spread of female foeticide as well as amniocentesis for sex determination are playing vital role in female foetus induced abortions son which is called high-tech sexism by Amrita Sen. The female foeticide was cited as the main reason for the decline in sex ratio. The other reasons included are neglect of the girl child resulting in higher female mortality, maternal death, dowry death, female infanticide, and male migration (Ghosh, Goyal and Balda in 2005)
Srivastava, Dasgupta and Rai (2005) in a study conducted on 200 married men and women to view their attitude towards the girl child and the declining sex ratio in Bhopal found that the reasons for not preferring girls over boys include that since bringing up girls is a costly affair and a wasted investment as they have to be given married in their appropriate age, arrange for dowry is difficult affaire. there is also a fear of providing safety inside home for girls including subject to chances of harassment at home as well as in workplace.
It could be assuredly reviewed that the investigations have analysis various dimension of declining child sex ratio and its root causes and effect in existing social situation.

## Methodology

Research in common parlance refers to a search for knowledge. It can be defining research as a scientific and systematic search for pertinent information on a specific topic. In fact,

# IJFANS INTERNATIONAL JOURNAL OF FOOD AND NUTRITIONAL SCIENCES ISSN PRINT 23191775 Online 23207876 

Research paper © 2012 IJFANS. All Rights Reserved, UGC CARE Listed ( Group -I) Journal Volume 11, S Iss 3, 2022
research is an art of scientific investigation. The researcher has also enlisted the significance of processing and analysis of data in the scientific study and the highlight the process of processing and analysis of data which have been used in research work. A systematic interview has been conducted by the researcher for collection of primary data. The device hasdesigned considering the objective of the study. It has been settled based on experimental study and field test that have been undertaken before beginning of the data collection fromthe selected respondents. The interview schedule has been contained of close-ended questionswhich has been separated into five major parts such as, socio economic status consciousness on sex decision viewpoint towards children. reason for sex preferences and treating practices of the children. A two - points and three-points, rating scale have only been used to measure the opinion on their child sex ratio. After the data collection, data has been classified, tabulated and interpreted in terms of simple percentage calculation to know more about the results of the study. Only 200 respondents in two blocks namely Mayureshwar Block and Nalhati Block have been covered in the present study. Hence, calculation may not be generalized to other areas which are scope and limitation of the study.

## Area of study

Having highest level of improvement in respect to child sex ratio is internationally found in Mayureshwar block-II from 2001 in 928 to 2011 in 963 and have a highest positive change in child sex ratio which is 35 in number - a increase with respect to 1000 males. The fact is that significant and drastically decline an imbalance child sex ratio in Nalhati as reported by census from 2001 in 996 to 2011 in 954. The trend of son preference in Nalhati-II block are found to be negative in child sex ratio (-42).

## Sampling methods

In this study, the researcher has been selected as a study area of four villages and having more than 200 households in order to collect primary data from selected villages come under Mayureshwar-II Block and Nalhati-II Block. The researcher has made a systematic study and collecting data in same manner from the households of the villages and blocks are as follows:

Table No -2: Selected blocks and villages for the study.

| Block | Village Name |
| :--- | :--- |
| Mayureshwar-II | Bhudharpur |
|  | Madhaipur |

Figure 1: Location map of the study area

## - Source of data and tools of data collection

Source of data and tools of data collection are three types-primary, secondary and tertiarydata which are collected by researcher by field visit or sources data collection (primary data). Documentary source of data collection are those collected by the researcher from documentary sources (secondary) and a territory source use and help of internet.

## - Interview schedule of household members-

Interview is close contact and interaction including dialogue between two or more persons of the household members and provides an opportunity to collect the facts about the problem of the study. There are so many technique to collect the primary data in social research interview and structure schedule are considered as the common tools.

## - Interview schedule for key personnel-

Interview with key personnel is used to collect addition information from household members. It is recommended to focus the questions on key personnel of the concern for the child sex ratio, socio-economic program to keep the interview as short as possible.

## - Census data-

Census is survey conducted on the full set of observation objects belonging to a given population or groups at a point in time collected data through administrative records. Census data is decadal documentary source of data and analysis of data in social research interview for studying in child sex ratio and its consequences.

## Findings Objective 1

To the study area, socio economic condition and status of household in the specific villages have changed pattern of child sex ratio significantly. On the other hand, raise quality of life is a personalized concept where the individual in the society is considered to be developed by developing the Socio-economic condition in the study area. The problem of low literacy rate is realised by disparity across different castes 1 also. In addition, there is a long gender gap in study area and analysing the reason of poverty and downward socio economic is the factor

In Mayureshwar block-II, according to the 2011 census which actually declined sex ratio over the figure of previous census except one village named Madhapur has slightly improved by 11 points. It has been collected data through field visit by the researcher himself and found a huge increased of sex ratio in four villages with shed new light on the dynamic trends.
In Nolhati ||Block showed a significant improved in overall sex ratio during 2001 to 2011 in two villages Kumarsanda and Baneshwar (increase of 71 and 34 points). According collecting information (2020 to 2021) from the respondents is showing a decline trend in two villages of Nalhati || block, which is matter of concern.

It was clear analysis of the above table huge. During 2001 to 2011 census child sex ratio has been registered among four villages in Mayureshwar-II block and showing an improvement Trend in two villages increase of 324 and 314 points, and rest of 2 villages which are having significant decline in 437 and 293 points.
From the investigation the table reviled that increase of child sex ratio in three village of Mayureshwar-II Block respondents were of the view that social status of family is prominent reason behind the improved of higher child sex ratio and one village named Mahesha has a dramatic declined by 875 out of 1000 that according to researcher analysis female child deficit which occurred as female child disrespect in society.
In the same way studied villages of Nalhati-II Block has documented documentaries source from 2001 to 2011 census, one village named Baneshwar shows increase of child sex ratio by 177 points. while other two villages named Atkula and Salisanda, a decadal decline of (-208) points and (-365) points was regarded as very substantial decreased and a matter of serious concern for declining child sex ratio.
In the above table shows the responses regarding the knowledge of the respondent about any policy which encourage the birth of girl child resulted a dramatically improvement in three villages, i.e., Baneswar shows a number of 1400 of females to that of 1000 male child. Atkulia shows 1167 of female towards 1000 of male child and Salisanda stands 1000 as balanced child sex ratio. The villages of Baneshwar, Atkulia and Salisanda are showing considerable signs of improvement.

Source：data compiled from collected primary source
Based on field，survey that table 7 indicate that decision making regarding childbirth plays a significant role in determining child birth caste wise awareness and knowledge about child birth depend on social cultural and economic issue．Child birth decision of respondents i．e．， $55.6 \%$ are scheduled caste， $77.8 \%$ respondents of scheduled tribe， $65.9 \%$ of Muslim caste respondents（both－wife and husband）and $56.5 \%$ of others community have made decision for child birth in Mayureshwar－II Block．
The statement was very relevant as respondents are helpless and kind hearted．A mother cannot discriminant their child on the basis of their sex and every child is equal in the eyes of mother．In the study of Nalhati－II block，childbirth decision of respondents i．e．， $74.2 \%$ of caste respondents（both wife and husband）schedule caste， $75 \%$ of respondents schedule tribe． $80 \%$ of respondents Muslim and $80 \%$ respondents of others community．

From the survey data, table - 9 revealed that the knowledge was clear from the analysis of above table that majority of the respondent of Nalhati-II Block opinion as caste wise that is $80.6 \%$ of scheduled caste, $100 \%$ of schedule tribe. $90 \%$ of Muslims and $20 \%$ of others community want to have one boy and one girl because it will minimise the pressure to them mostly upper caste recorded lowest child sex ration as many factors are responsible.
Table 9 Reasons for son preference among different caste and community. The respondents regarding the above-mentioned question shows the level of desperateness of respondents to have male child. The above table shows the number of efforts of the respondents to have male child. Majority of respondents that is $24 \%$ of schedule caste, $66.7 \%$ of scheduled tribe, $0 \%$ of Muslim and $57.9 \%$ of others community express their reasons behind the carryforward lineage. The respondents of Muslim, girls will try happiness of others i.e., $33.3 \%$.The minority of respondents express their desire that son will look after them during old age that is $28 \%$ of schedule caste and $33.3 \%$ of Muslim community.

## IJFANS INTERNATIONAL JOURNAL OF FOOD AND NUTRITIONAL SCIENCES ISSN PRINT 23191775 Online 23207876

The responses regarding the person to be caused for daughter preference shows the above table. Minority of respondents i.e., $33.3 \%$ of schedule caste. $50 \%$ of others community and $16.7 \%$ of Muslim caste express their views as the girl can help in household work as survey reflects the couple's decision. The schedule caste respondents of $50 \% 16.7 \%$ of others and $44.4 \%$ of Muslim community responded that daughter is more likely to remain closed parentsthan son.

## Objective 3.

To understand the sex specific differences in the child care practices. The data collected from the study define very clearly about the trend of the child caring facilities of the study area. Parental caring was observed from the study shows some differences in buying new items between boys and girls.

Figure 2: Buying of New Items for Child in SC Households

On the basis of study, the above table exposed that majority of respondents of schedule caste reported that a significant difference between boys and girls of buying feeding bottle for their child care. The above table deals with impact of intervention regarding the view of the respondents that buying of new feeding bottles for child care i.e., $64 \%$ (boys) and $24 \%$ (girls). An overwhelming maturity of the respondents are buying new towel i.e. $88 \%$ (boys) and $90.91 \%$ (girls), and in buying in new mosquito net i.e. $56 \%$ (boys) and $75.76 \%$ (girls) and buying new toys i.e. $88 \%$ (boys) and $75.76 \%$ (girls) are used for child care.

Figure 3: Buying of New Items for Child in ST Households

## IJFANS INTERNATIONAL JOURNAL OF FOOD AND NUTRITIONAL SCIENCES ISSN PRINT 23191775 Online 23207876

Research paper © 2012 IJFANS. All Rights Reserved, UGC CARE Listed ( Group -I) Journal Volume 11, S Iss 3, 2022
From the investigation the above table revealed that majority scheduled tribe respondents are buying new feeding bottle for their child care i.e., $36.35 \%$ (girls) and a significant change as not buying for boys. On the contrary, buying for new towels $100 \%$ (boys) and $100 \%$ ( girls) is found a balanced decision and in respect to buy new mosquito net i.e., $100 \%$ (boys) and no answered for girls child, a huge bias focus by the respondents. It may be noted that another outstanding changed in respect to buy toys i.e., $100 \%$ (girls) and respondents have not shown a respectful manner to boys.

# IJFANS INTERNATIONAL JOURNAL OF FOOD AND NUTRITIONAL SCIENCES ISSN PRINT 23191775 Online 23207876

Figure 4: Buying of New Items for Child in Muslim Households

It was observed from survey report that above table, there was significant association between boys and girls of Muslim community. Respondents reported in buying of new feeding bottles for their child care i.e., $63.16 \%$ (boys) and $58.14 \%$ (girls), buying new towel $78.95 \%$ (boys) and $72.09 \%$ (girls), majority respondents of Muslim community in respect to buy mosquito net shows a little bit bias attitude i.e., $97.37 \%$ (boys) and $65.12 \%$ (girls). On the contrary, it was also observed that no significant bias specially girls in buying new toys i.e., $89.47 \%$ ( boys) and $100 \%$ ( girls). Some facts related to child sex ratio are the main causeof decline the sex ratio due to biased attitude towards female child.

Figure 5: Buying of New Items for Child Care in OTHERS Households

On the basis of field survey, table details that others community respondents wish to buy new feeding bottle i.e., $63.16 \%$ (boys) and $58.14 \%$ (girls) further study noted that respondents wish to provide new towels for child care i.e., $78.95 \%$ (boys) and $72.09 \%$ (girls). Respondents have given more importance in buying new mosquito net i.e., $77.78 \%$ (boys) and $53.33 \%$ (girls). The majority respondents have provided more importance in buying toys i.e. $100 \%$ (boys) and $96.67 \%$ (girls).

Source：data compiled from collected primary data
This is a most significant issue of the research as it shows the level of respondent＇s caste and community wise household having knowledge regarding decline child sex ratio．In Mayureshwar II Block，majority of the respondents of schedule caste i．e．， $33.3 \%$ reported that they know about the declining child sex ratio and $55.7 \%$ of the respondent did not know what the declining child sex ratio is．Scheduled tribe respondents that are $44.4 \%$ having knowledge and $55.6 \%$ respondent that they have no knowledge about it．The majority respondents of Muslim community i．e．， $48.8 \%$ reported that they have sufficient knowledge and $51.2 \%$ respondents that they know nothing．Respondents of other community i．e．， 21.71 respondents that they have awareness about decline child sex ratio and $78.3 \%$ know nothing．
Similarly．in Nalhati II Block．the response given by the respondent of schedule caste made it white obvious that very few people have knowledge about decline child sex ratio i．e． $29 \%$ and $71 \%$ respondents have no conscious．In scheduled tribe community respondents $50 \%$ awareness and $50 \%$ have no awareness．Muslim community，majority respondents $47.5 \%$ that they have knowledge and $52.5 \%$ have no knowledge．It can be concluded that majority of the respondents of others community that is $32 \%$ admit that they have knowledge of decline child sex ratio and $62 \%$ respondent that they have no idea．

## Reasons on declining child sex ratio．

Table shows the reasons of declining child sex ratio as discriminations of girl child in Mayureshwar－II Block．It is clear from the above table discrimination of child sex ratio that
$48.1 \%$ respondents of schedule caste agreed with the fact that selective abortion is responsible for decreased sex ratio whereas respondents i.e., $51.9 \%$ desire of male child. The respondents of schedule tribe i.e., $44.4 \%$ responded about the sex selective abortion of which respondents $55.6 \%$ who opined for desiring male child. It may be concluded that majority of the respondents of Muslim community i.e., $43.9 \%$ were the view that sex selective abortion isthe prominent reason behind the decline child sex ratio, whereas $56.1 \%$ responded opinedthat desire of male child. $47.8 \%$ respondents of others community give the reason for sex selective abortion followed by $52.2 \%$ respondents who find that social factor that desire of male child. This indicates a strong son preference and the use of sex selective technology among the respondents.

## Conclusion

The researchers in the current study has tried to find out the elements which impacts on declining child sex ratio in selected districts The rational conclusion determined from the study observed the remarkable strength of the people consider that female as weaker sex and large number of them do not have proper knowledge on child sex ratio. Responses of the household members clearly bring out discrimination between girl and boy child. Skewed gender ratio in favour of male child is an indicator to the society in the study area. A section of society has an awareness about discrimination and another section is suffering withdiscrimination behaviour with women right from childhood, even when they are in the womb in the form of female foeticide. When they grow up there is discrimination in providing female child proper medical facilities that result more mortality in female as compared to male ( 0 to 6 ) years of age. The problem is more severe in the society where per capita income is high; mail child is preferable to female child because of their financial social and cultural advantage. Though government has taken many steps to make the people aware about the eviland many programs have been started as a part of campaign against female foeticide and infanticide to improve the gender ratio in the country. But all the government effort could not bring much change to get better result. The present paper gives fine dimensional approach to fight against the distorted gender ratio. The entire stakeholder should identify the role and should join hands to win the battle against the gender discrimination and determinations.
