## **Abstract:**

Man has complex brain that control unique emotions of inter personal and intra personal relationships through language of expressions. Human emotions are meta-cognitive which influence by socio-lingual communications. Linguistics is defined by a definitive region in the brain which controls the language pattern and human psychology design thinking. The focus of this research paper is to build the human emotions and interpretations.

**Keywords:** Psychological, language, sexual medicine, communication.

It is believed that language is a part of human emotions which controls bi chemicals of human brain. The language acts as an emotional signal of human health like fear, anxiety, romance, phobia, hesitation, nervousness, hatredness personal relationship and emotional disturbances as well. These language disturbances are visibly observed in trauma condition. According to the psychological constructionist Conceptual Act Theory (CAT), language plays a role in emotion because language supports the conceptual knowledge used to make meaning of sensations. Application of various linguistic approaches in different situations are undoubtedly influential and reflect on human psychology as well. There is growing evidence for the CAT's prediction that concept knowledge supported by language plays a constitutive role in emotions.

According to Dunsmore and Halberstadt, 1997; Hakim-Larson et al., 2006 parents' beliefs about the value of emotions guides both how parents talk about emotions to children, but also how parents react to their children's emotions. According to Lindquist et al.,2006,2014 people's access to the meaning of emotion words impairs their ability to subsequently perceive emotions on faces access to the meaning of emotion words such as "disgust," vs. "anger," vs.

“fear,” vs. “sadness,” individuals perceive posed emotional facial expressions with wrinkled noses, scowls, wide eyes, and frowns which are merely unpleasant. These findings suggest that access to the meaning of emotion words (and the concepts that they represent) is an essential component of understanding the discrete meaning of emotional facial expressions.

Psychology which deals with the mind and cognitive analysis of human differs from person to person time to time place to place and situation to situation. No one can assume or predict the psychological fluctuations of human beings in various situations. The same situation makes different people react different ways. The cognitive analysis is vibrant and dynamic and one cannot define what exactly the psychological aspects one exhibits to the situations.

Moreover, it is a known fact that generally human beings are very close physically with whom they have good bonding psychologically. Hence, the people who are sexually bonded care share and flare among themselves openly because of their physical and psychological bonding. The sexual disorders appear in many cases where they have psychological issues. Hence, the root cause of sexual problems in human beings is psychological differences only. In the similar manner, the usage of language by people at various situations also differs from person to person. Some people react and use verbal communication and some do not even speak anything and show their negation through silence. This sort of psychological behaviour is especially shown in women. They don't talk or keep silent when they are angry or don't like the other person who they negate. The language or communication can be defined as verbal and nonverbal where the usage of words through voice and writing is called verbal communication and nonverbal communicators are like facial expressions, gestures and postures including of silence with negation. Hence, this paper throws light on the various language perspectives and its role in related to psychology and sexual disorders with a case study analysis by doing the pattern analysis among selected group of people.

Human emotional touch through language and its influence on health is observed through in Artificial intelligence and machine learning ways. The experiment works in such a way to find out on how and in which way the language and the usage of words influence the human psychology along with the AI and ML. Human emotional touch through language with respect to psychological analysis is done through pragmatic way. The complexity level of cognitive mind and controlling factors through artificial intelligence and machine learning design to

control the challenges of cognitive emotions are streamlining those feelings towards the balanced psychological cognitive stableness

### **Conclusion**

Human emotions through linguistic approach managing of psychological challenges in traumatic situations which are observed in this study touch deeply which influence on health and observed with pragmatic analysis through Artificial intelligence and machine learning by collecting samples and data. Moreover, in understanding and identifying the role of language in various aspects especially related to health perspectives like how positive language effects a human brain and how a negative language affects a brain negatively. This made me think that language plays a vital role on health. However, it is observed that off late internet driven world has witnessed a lacuna of sharing and caring tendency due to the materialistic life style. People are much involved in mobiles rather than personal one to one interactions. Hence, there is a need of the hour to understand how the relationships got deteriorated because of technology which lead to many mental and physical health issues. Hence, the main purpose of my proposal is how the language influence the mental and physical health of a person and how it leads to psychological and physical disturbances among the human beings in the society. Apart from it, this research also highlights how the technology driven society influence the day today lives and individual mind sets as well.

Hence, the present research questions and finds out the quest for how language, health and brain are interconnected through this research paper partially. At the outset there is a lot to do research in this field to understand the various life patterns of brain through language.
